THE BOMBING OF AMERICA

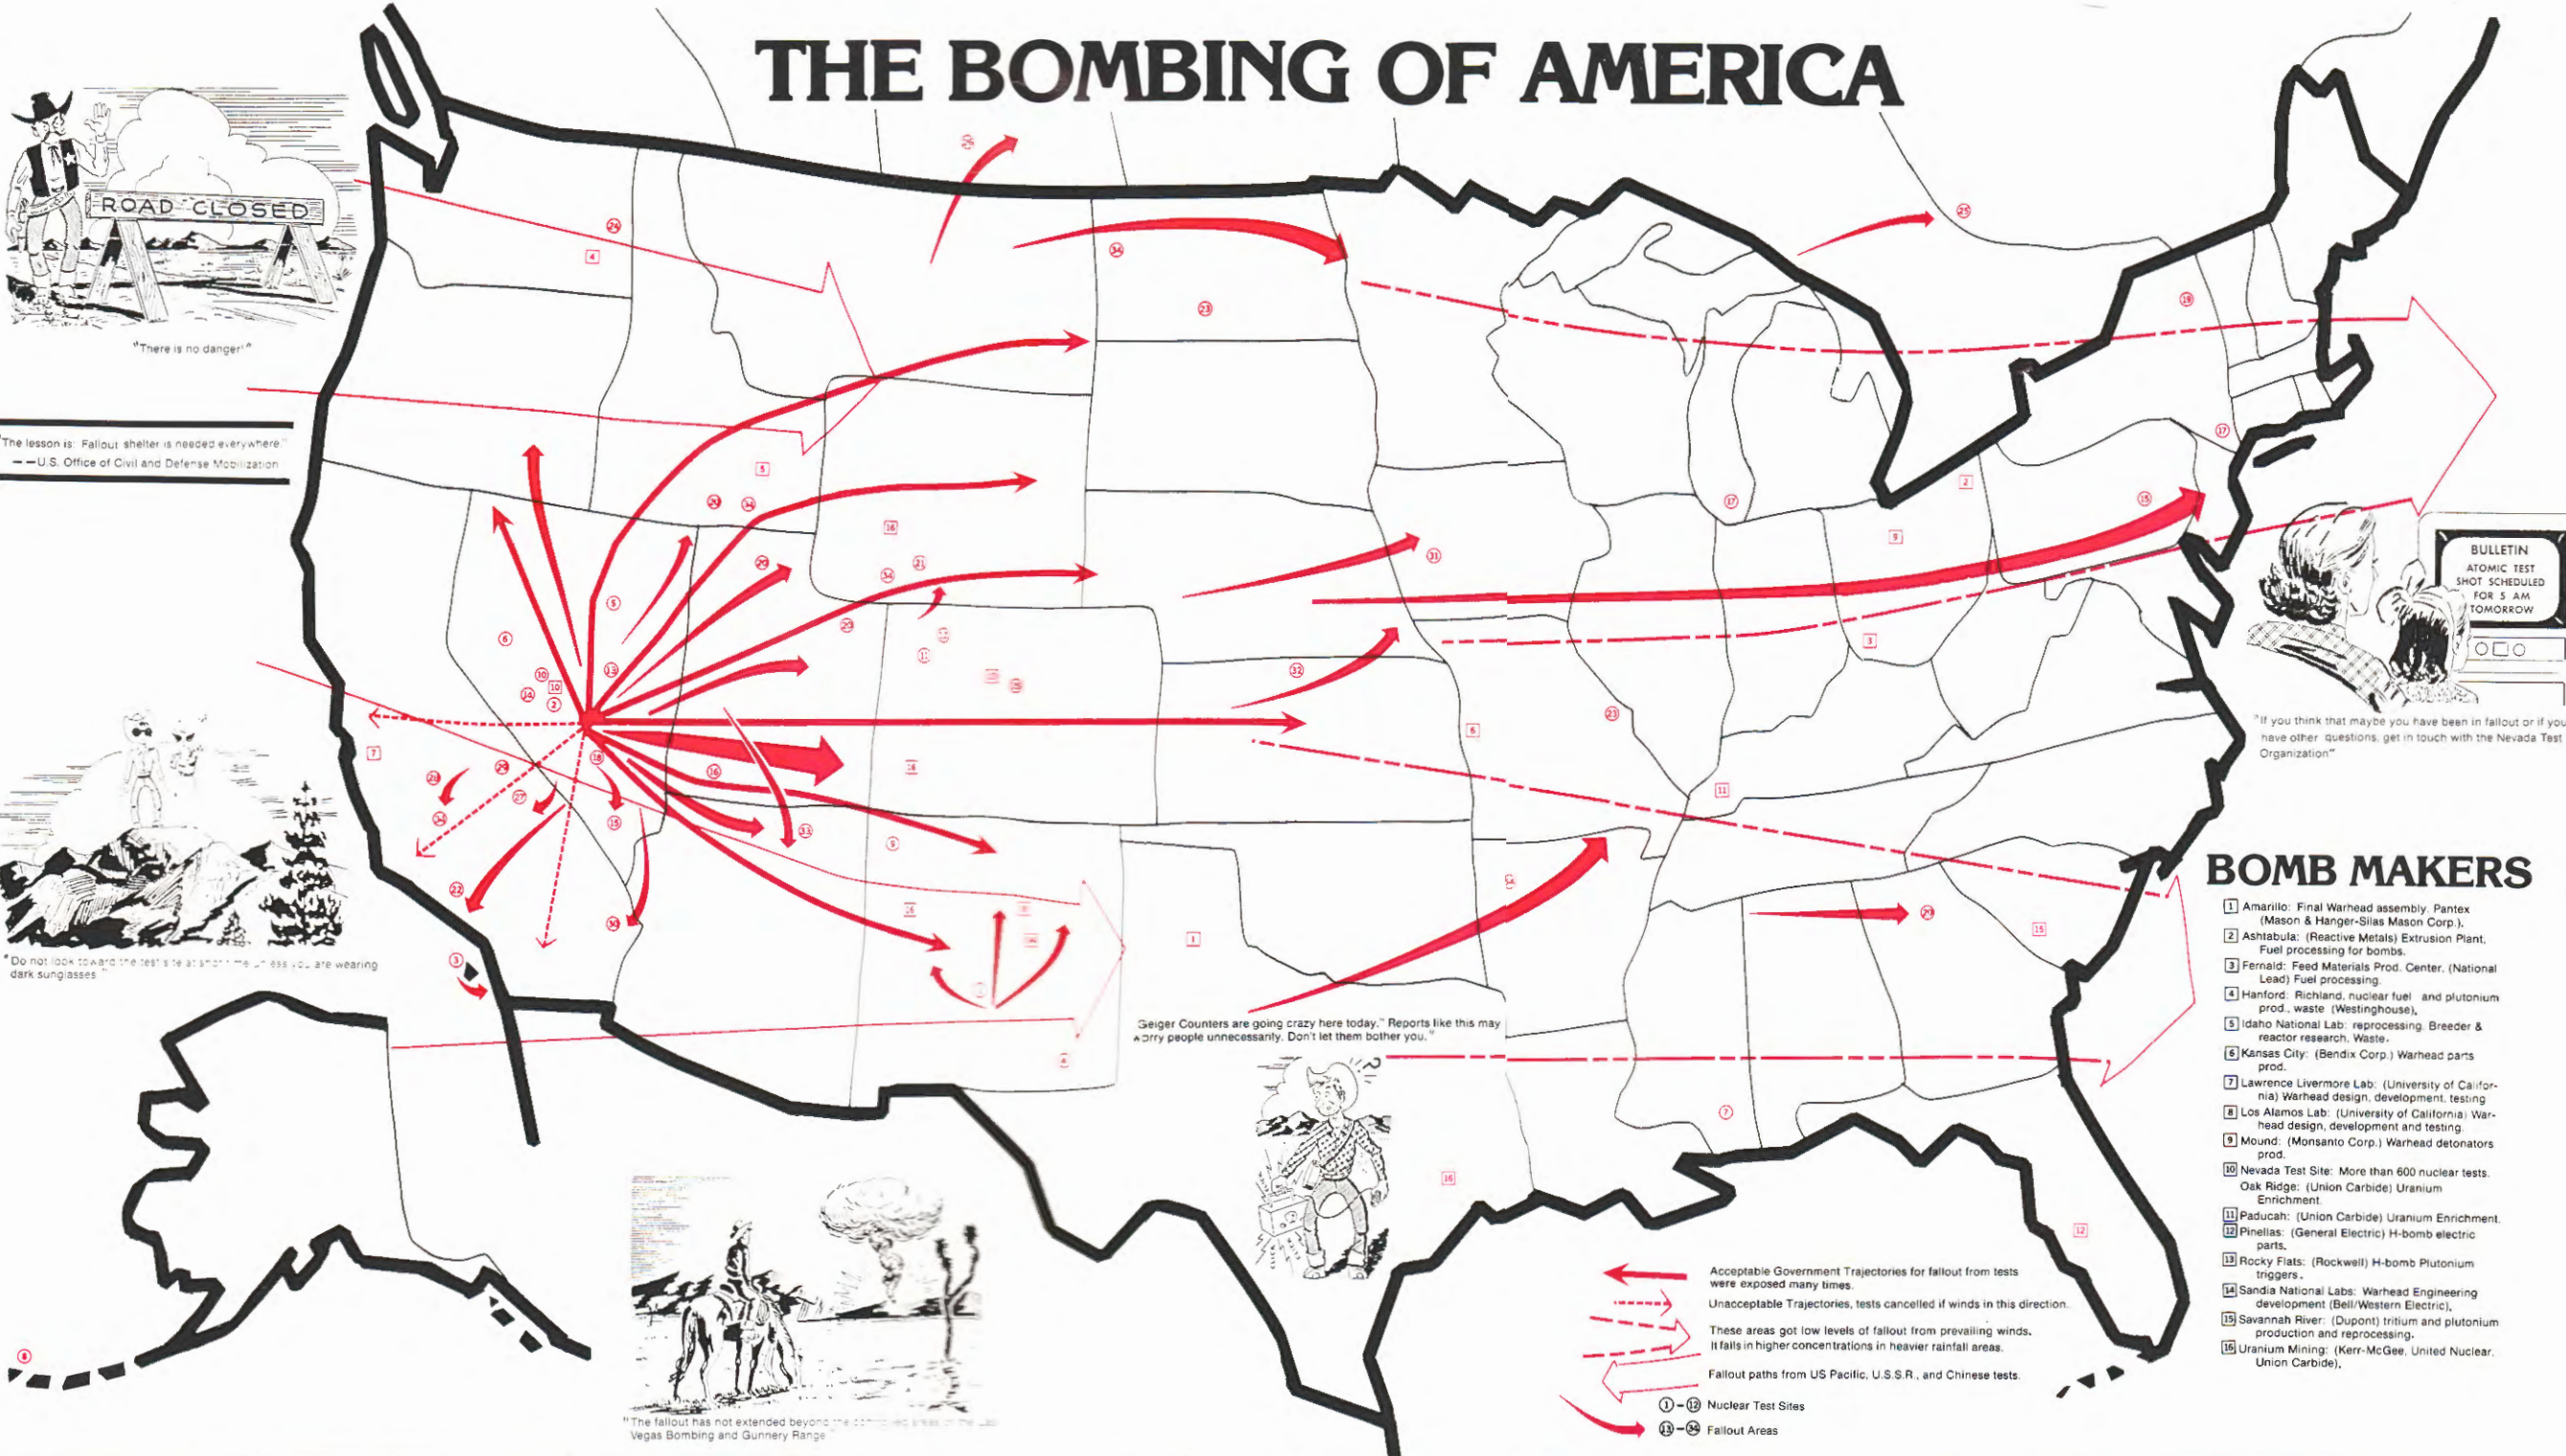

"There is no danger!"

"The lesson is: Fallout shelter is needed everywhere!"
— U.S. Office of Civil and Defense Mobilization

"Do not look toward the test site at 5:00 P.M. unless you are wearing dark sunglasses."

BOMB MAKERS

- 1 Amarillo: Final Warhead assembly. Pantex (Mason & Hanger-Silas Mason Corp.).
- 2 Ashtabula: (Reactive Metals) Extrusion Plant. Fuel processing for bombs.
- 3 Fernald: Feed Materials Prod. Center. (National Lead) Fuel processing.
- 4 Hanford: Richland, nuclear fuel and plutonium prod., waste (Westinghouse).
- 5 Idaho National Lab: reprocessing. Breeder & reactor research. Waste.
- 6 Kansas City: (Bendix Corp.) Warhead parts prod.
- 7 Lawrence Livermore Lab: (University of California) Warhead design, development, testing.
- 8 Los Alamos Lab: (University of California) Warhead design, development and testing.
- 9 Mound: (Monsanto Corp.) Warhead detonators prod.
- 10 Nevada Test Site: More than 600 nuclear tests. Oak Ridge: (Union Carbide) Uranium Enrichment.
- 11 Paducah: (Union Carbide) Uranium Enrichment.
- 12 Pinellas: (General Electric) H-bomb electric parts.
- 13 Rocky Flats: (Rockwell) H-bomb Plutonium triggers.
- 14 Sandia National Labs: Warhead Engineering development (Bell/Western Electric).
- 15 Savannah River: (DuPont) tritium and plutonium production and reprocessing.
- 16 Uranium Mining: (Kerr-McGee, United Nuclear, Union Carbide).

Acceptable Government Trajectories for fallout from tests were exposed many times.
Unacceptable Trajectories, tests cancelled if winds in this direction.
These areas got low levels of fallout from prevailing winds. It falls in higher concentrations in heavier rainfall areas.
Fallout paths from US Pacific, U.S.S.R., and Chinese tests.

- ①-⑭ Nuclear Test Sites
⑮-⑯ Fallout Areas

"The fallout has not extended beyond the controlled areas of the Nevada Bombing and Gunnery Range."

THIS MAP shows some of the impact of fallout on the U.S. from American nuclear explosions. It is not the total picture. Only a limited number of locations impacted by fallout east of the Nevada Test Site are marked. If the fallout from all 84 above ground tests were marked, the map would be too cluttered to be readable. Numbers on the map correspond to descriptions below.

FALLOUT:
Of the three main effects of nuclear explosions: heat, blast and radiation, only the radiation effects extend beyond the area of the explosion. The radiation effects are the most deadly and long lasting of the three. Fallout is made up of the products given off by the fissioning process and the unused portions of the nuclear device. It is the most important of the radiation effects given off by a nuclear explosion and is carried by the winds away from the site of the explosion. Fallout falls back to the earth slowly as it travels, with the heavier particles falling first and closer to the explosion site. Fallout can travel thousands of miles before the finer particles return to earth. It falls in higher concentrations in heavier rainfall areas.

- WHERE NUCLEAR EXPLOSIONS HAVE TAKEN PLACE**
- 1 1945, July 17: "Trinity" a 19 kiloton nuclear device was exploded off a 100 foot iron tower in rural New Mexico, near Alamogordo. Fallout from the world's first nuclear explosion burned cows 30 miles downwind, most of New Mexico received low levels of fallout.
 - 2 1951 - Present: The Nevada Test Site, 65 miles northwest of Las Vegas, Nevada, where since January 27, 1951 more than 600 announced nuclear explosions have taken place. Not all nuclear explosions at the Nevada Test Site have been announced. The blasts have ranged in size from a yield of a few tons to over 1.3 megatons. 84 of the nuclear devices were exploded above ground and 17 were British devices. 33 safety tests releasing plutonium were also conducted above ground there.
 - 3 1955, May 14: "Wigwag," a 30 kiloton nuclear device, was exploded 1000 feet underwater off the coast of California, near San Diego. Radioactive water showered thousands of soldiers on ships and hit San Diego.

- 4 1961, December 10: "Gnome," a 3.1 kiloton hydrogen device, was exploded 1184 feet underground 25 miles southwest of Carlsbad, New Mexico (the first so-called peaceful nuclear test) leaked up a drill pipe carrying cables, 10,000 rads/hr at pipe head. The explosion hit communities downwind with a very significant dose (2 rads).
- 5 1963, May-June: Safety tests using plutonium and uranium were exploded on the Tonopah Test Range, east of Goldfield, Nevada, contaminating most of the Great Basin with higher levels than the rest of the United States.
- 6 1963, October 26: "Shoal," a 12 kiloton nuclear device, was exploded 1,200 feet underground in solid granite near Fallon, Nevada (experiment in treaty verification).
- 7 1964, October 22: "Salmon," a 5.3 kiloton nuclear device, was exploded in a salt bed 2717 feet underground near Hattiesburg, Mississippi.
- 8 1966, December 3: "Sterling," a 380 ton nuclear device, was exploded in the cavity produced by the Salmon device (verification/detection, and treaty evasion test).
- 9 1965, October 29: small treaty verification detection test exploded, February 10: small treaty verification detection test 1971, June 6: an ABM test of over 5 megatons (largest US test), was exploded on Amchitka, in the Aleutian Islands in Alaska.
- 10 1967, December 10: "Gassbuggy," a 29 kiloton Peaceful Nuclear Explosion (PNE - not for defense), was exploded 4,240 feet underground near Dulce, New Mexico (natural gas stimulation test).
- 11 1968, January 19: "Faultless," with a yield of between 200 kilotons and 1 megaton was exploded 3,200 feet underground near Warm Springs, Nevada, causing a 1,200 foot fissure.
- 12 1969, October 9: "Rulison," a 40 kiloton PNE, was exploded 8,443 feet underground near Rulison, Colorado (natural gas stimulation test).
- 13 1973, May 17: "Rio Blanco," three 33 kiloton PNE's were exploded as a single shot, from 5,830 feet to 6,590 feet underground in the Piceance Basin of Colorado (last U.S. natural gas stimulation test).

- FALLOUT:**
- 13 This is the deadly foot print of high level fallout from 34 years of testing at the Nevada Test Site. 54 nuclear devices were exploded above ground before 1963, exposing thousands of residents of Nevada, Utah, northern Arizona and parts of California to fallout levels hundreds of times background levels. Some communities received doses of up to fifteen rads from a single shot. Tens of thousands of members of the United States Armed Forces received radiation exposures during exercises conducted during nuclear tests. Studies have shown a doubling of leukemia rates among those involved in just one shot, "Smoky," 1957. Utah children born in the fallout areas during aboveground tests show a 2 to 2.5 fold increase in childhood leukemia. Suits have been filed from over 1,200 downwind residents for fallout induced cancer deaths and injuries. In 10 of 24 test cases it has been ruled that the government was negligent. 42 underground tests have been admitted to have leaked since above ground testing ended in 1962. The last announced leak from an underground test was September 25, 1980.
 - 14 1953: Three dirty tests killed over 5,000 sheep in a ranching area in eastern Nevada. Burns caused the deaths of 16 horses for which the US Government paid the only compensation ever awarded.
 - 15 1955, February 18-May 15: 14 above ground tests with a total of 167 kilotons spread very significant radiation downwind. The Weather Bureau reported that a huge radioactive cloud, resulting from Nevada nuclear tests, stretched from Nebraska to New Jersey. High levels were measured over Denver. One cloud went astray when the wind changed directions and hit North Las Vegas with 300 millirads (= 3 chest X-rays). This was common with many Nevada tests and is used here only as an example of the extent of fallout spread.
 - 16 Southwest Utah, St. George—"Dirty Harry." May 19, 1953: Government documents reported "Highest level of fallout ever measured in a populated area." This area was hit again in 1955, 1957, 1958, 1961, and 1962.
 - 17 Spring 1955: The water in Lake Michigan was reported to have radiation counts higher than ever recorded before from Nevada tests.

A headline from the *Chicago Times*, March 18, 1955, read "Lake a Bit Radioactive. But Don't Worry About It." Counts as high as 14,000 per min. were present in the air over Chicago. From March 11th to 18th, 1955, the air over New York City measured the highest airborne radiation levels ever recorded in New York.

Spring 1953: Wind changed, dusting Bunkerville, Nevada area with heavy fallout. One hot spot showed 15 rads on the riverside trailer court (= 150 chest X-rays).

1953, April 27: A massive thunderstorm over upstate New York brought down fallout from "Dirty Simon," an April 25th Nevada nuclear explosion, over Troy and Albany. Puddles of rain water on one campus were measured at 270,000 microcuries of radiation per liter, thousands of times above the safety level of 100. The normal level is 1 per liter.

Fedonia, a small Mormon community in Northern Arizona, was hit heavily by "Dirty Simon" and other tests. Leukemia clusters claimed 4 out of the 200 residents of Fedonia within a decade.

1952, May 7: Fallout from "Easy," a 23 kiloton Nevada nuclear test, resulted in thyroid doses of 3 to 18 rads to the large population of Salt Lake City, Utah. Very significant fallout from "Easy" was measured in Ogden, Utah. Fallout from cratering tests in the summer of 1962 settled over the Salt Lake City area. Very significant levels of fallout were measured in Salt Lake City from "Sedan" July 6, 1962, a 140 kiloton PNE that left a crater 1,280 feet wide and 320 feet deep. It was the worst fallout incident over a heavily populated area to date. Milk was ordered off the market by the Utah Health Department. Fallout left a trail of hot spots and leukemia clusters across Northern Utah.

"Sedan" was followed by "Little Feller" on July 7, "Johnnyboy" on July 11, "Smalby" on July 14, and "Little Feller II" on July 17. Fallout was measured in Atlanta, Georgia. Fallout settled over the Orem, Utah area. In a one mile circle of the fallout area nine people died of leukemia in the next few years. Southern Idaho was hit heavily.

In Northeast Utah, fallout settled in higher concentrations from the way wind sweeps the Uinta Basin and Uinta Mountains. Dr. Robert C. Pendleton reported the "highest level of iodine 131 in milk and people ever measured downwind of the Nevada Test Site. Excess thyroid cancer deaths and illnesses resulted in this area.

- 21 July, 1957: Very significant fallout reached Southern Wyoming from "Smoky," the most famous of aboveground tests that exposed many atomic vets.
- 22 1958, October-November: In a rush to conduct as many nuclear tests as possible before entering a moratorium against testing, two tests were fired at the Nevada Test Site under unfavorable wind conditions, sending low level fallout over Los Angeles. A November, 1958 US Health Service, Division of Radiological Health Protection, document read: "If these levels get out to the public we've had it." Fallout was also measured over Los Angeles during the 1955 test series and from a plutonium safety test in 1956.
- 23 Spring 1959, fallout levels of Strontium 90 peaked highest in America in St. Louis, Missouri and Mandan, North Dakota, as a result of global fallout from U.S. and U.S.S.R., and Nevada tests the previous fall. Minnesota winter wheat crop contained levels above the then permissible levels. The milk supplies in Mandan, North Dakota exceeded the permissible levels, as did milk in St. Louis.
- 24 1962, June 22: A leak from "Des Moines," an underground Nevada test of June 13th, produced readings of radioactive iodine of 1,240 pc-liter in milk supplies of Spokane, Washington.
- 25 Fallout from PNE crater test "Schooner," December, 1968, was traced to the Canadian border, violating the 1963 Limited Test Ban Treaty. Canada reported unexplained increased levels of iodine 131 in milk.
- 26 December, 1970: Fallout from "Banberry," an underground test leak, crossed into Canada for the second violation of the Limited Test Ban Treaty by the U.S. in two years.
- 27 1980, September 25: "Riot," radioactive gas from a leak of an underground test, entered California. It took twelve hours for officials at the Nevada Test Site to order offsite monitoring of the leak. There were no monitors in Eastern California. The same area of California has been exposed many times.
- 28 December 12, 1963: Fallout from "Eagle" was tracked 140 miles from the Test Site over Central California.

- 29 June 29, 1967: Fallout from "Umbra" was tracked 90-100 miles. It dropped fresh iodine 131 on Death Valley and Shoshone, California.
 - 30 "Pike," March 13, 1964, a cloud of 130,000 cures 2,640 feet high, produced fallout levels of iodine 131 in milk on farms in southern California and Arizona.
 - 31 March 5, 1966: The "Red Hat" test explosion cloud of 1,000,000 cures was tracked 2,000 miles to Iowa.
 - 32 April 25, 1966: "Pin Strip" released 350,000 cures and was tracked all the way to Eastern Kansas and Nebraska. Some cows in Nevada were ordered off pastures, onto "dry feed," after iodine was found in milk and human thyroids.
 - 33 April 21, 1970: "Snubner" released 54,800 cures northeast to Ely, Nevada. It then turned, hit Southwest Utah and crossed the Grand Canyon.
 - 34 December 18, 1970: "Banberry," a cloud of 3 million cures 12,000 feet high, split into four sections, hitting (1) Bakersfield, California, (2) Powell and Laramie, Wyoming, (3) Southern Idaho, to the Canadian Border and into Minnesota, and (4) across Texas into Arkansas and Missouri.
- 1 curie = radioactivity of 1 gram of Radium
12 kilotons = 1 Hiroshima
1 rads = 10 chest X-rays
- SOURCES: Federal, Annual monitoring reports, offsite fallout maps (1951-1983); Files of Dr. Robert C. Pendleton, University of Utah Medical Center.
- Drawings and quotes from "Atomic Tests in Nevada," a U.S. Atomic Energy Commission, March 1957 safety pamphlet distributed downwind.
- Jointly produced by: Dawn Winders, 1321 East 400 South, Salt Lake City, Utah, 84102; and Lab Watch, Box 11635, Oakland, California, 94611.
